What are the differences between var, let, and const?

What are some features that are new with ES6?

My interpretation is that var is old school. **let** is similar to **var** in that you can make changes to the variable in certain circumstances. **const** stands for constant and a variable can not be changed. When I typed in the second question into Chat GPT it listed 11 items but wrote that these were just a few. Those I recognize are the arrow function, the let and const keywords and template literals.
